LITEPAPER

People Blockchain — Litepaper

The blockchain where every user is a verified human.

Owned by people, not VCs.

Our mission: put a blockchain in the hands of ordinary people — no code, no crypto skills, no bots, no insiders.

v1.1 · October 2026 · Numbers are preliminary and subject to community governance. Nothing in this document is a promise of income.

PRELIMINARY · NOT A PROMISE OF INCOME

v1.1 · 12 Oct 2026

1B	10%	0%	0
PPL, fixed supply	of every launched token to its community	of fees burned — all shared	VC or investor allocations

01

At a glance

Supply	**1,000,000,000 PPL**, fixed
Every launched token	**10%** of supply goes to that token's own community pool
Network fees burned	**0%** — every fee is shared
Who earns rewards	**Verified humans** (Telegram phone or Human Passport)

Funding	**Self-funded.** No VC. No investor allocation.
Network today	Public **testnet** — Cosmos EVM, chain id `people_97401-1` / EVM `97401`

02

The problem

Crypto was built for insiders. Most chains assume you can read code, manage seed phrases and spot a scam on your own.

Bots get the rewards. Airdrops and reward programs are farmed by scripts and fake accounts. Real people get a sliver.

Launches favour whales. Private rounds and insider allocations mean that the community often arrives last and pays the highest price.

03

Our answer

A blockchain for ordinary people. A phone or a browser is enough. Launch a token, mint club cards or raise money for an idea — with a form, not code.

Verified humans, not bots. Rewards go to accounts that passed a free human check. One person, one account. Sign-up alone earns nothing.

10% of every launched token goes to its community. Built into the protocol, not promised in a post: every standard launch sends 10% of its supply to that token's own community pool. It is never mixed with network fees.

04

Product

What you can do without code:

Tool	What it does	Status
No-code tokens	Name, ticker, image, supply. The token goes live on its own bonding curve; the first trade sets the price. 10% of supply goes to the token's community pool; the creator's share vests over 180 days.	Live on testnet
NFT club cards	Membership cards for a club, a café or a community — one per member, with an image you upload or generate.	Live on testnet
Fundraising	Collect support for a project with reviewed contract templates: escrow, vesting, token-weighted vote. Your community buys in on the curve, so demand sets the price — not a private round.	Live on testnet
AI contracts	Describe a smart contract in plain words. It is assembled from OpenZeppelin templates and you see the result before you deploy.	Live on testnet
Community AI agents	Agents that work for a group: a multisig community wallet with spending limits, whitelists and an emergency freeze. Parameters change only by token vote; every action is visible in the explorer.	Testnet: 1 community agent live

05

Technology

Cosmos EVM. People runs on a Cosmos EVM stack: Ethereum-compatible smart contracts and 0x addresses on a Cosmos chain.

Parameter	Value
Cosmos chain id	`people_97401-1`
EVM chain id	`97401`
Native coin	PPL (base denom `appl`, 18 decimals)
Address prefix	`people1…` (and the same account as `0x…` in EVM)
Network status	Public testnet — not mainnet

Validators. Validators run the network and are paid from the pre-allocated validator pool plus 30% of every network fee. Testnet validators run for testing only; opening validation and staking to the public is a later roadmap stage.

Verification — one check that you are a person. Free, done once:

- **Level 1 — Telegram:** share your phone number once in our Telegram bot. One number per founder. Earns 50% of base points.
- **Level 2 — Human Passport:** verify with Human Passport. Earns 100% of base points.
- **No verification, no points.** No founder points on testnet and no personal PPL rewards on mainnet without it.

Verification is free. No biometrics required.

LEVEL 0

Signed in

06

Tokenomics

Fixed supply: 1,000,000,000 PPL. Years 1–4: 0% inflation. From year 5, any new emission is capped at 2% a year and only by community vote.

Click a legend item to focus a slice.

- Community & rewards
- Validators & staking
- Team & founders
- Ecosystem treasury (DAO)
- Sold on the public curve on Base (PplCurveHub). PPL is credited right after purchase; transfers open at the full network launch.
- PPL/USDC pool at graduation; LP tokens locked for 24 months.

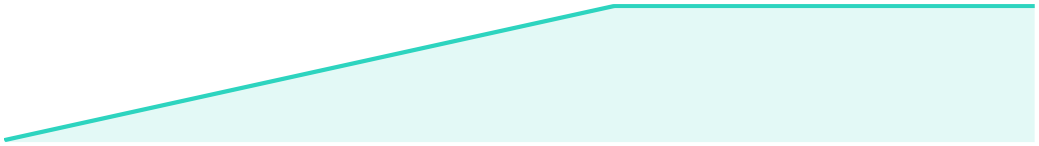

Community & rewards

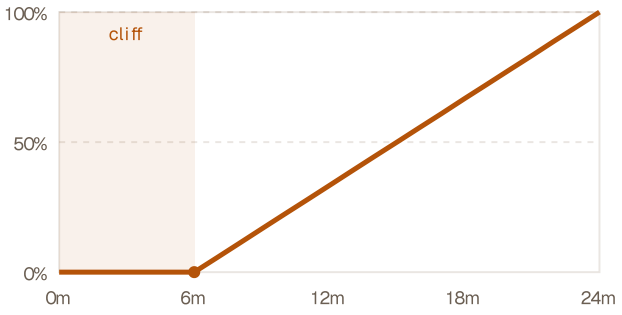

35% genesis bucket — founders, bounties, ambassadors, airdrops and onboarding rewards only from this pool (released over 6 years).

Share
35%

Amount
350M PPL

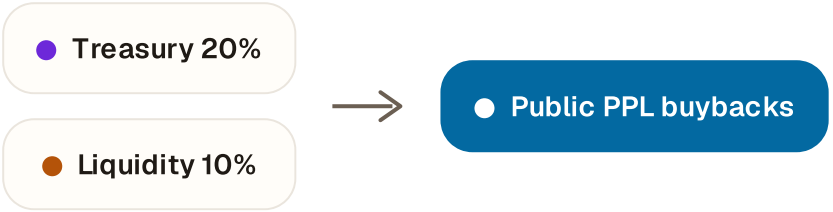

UNLOCKED OVER TIME

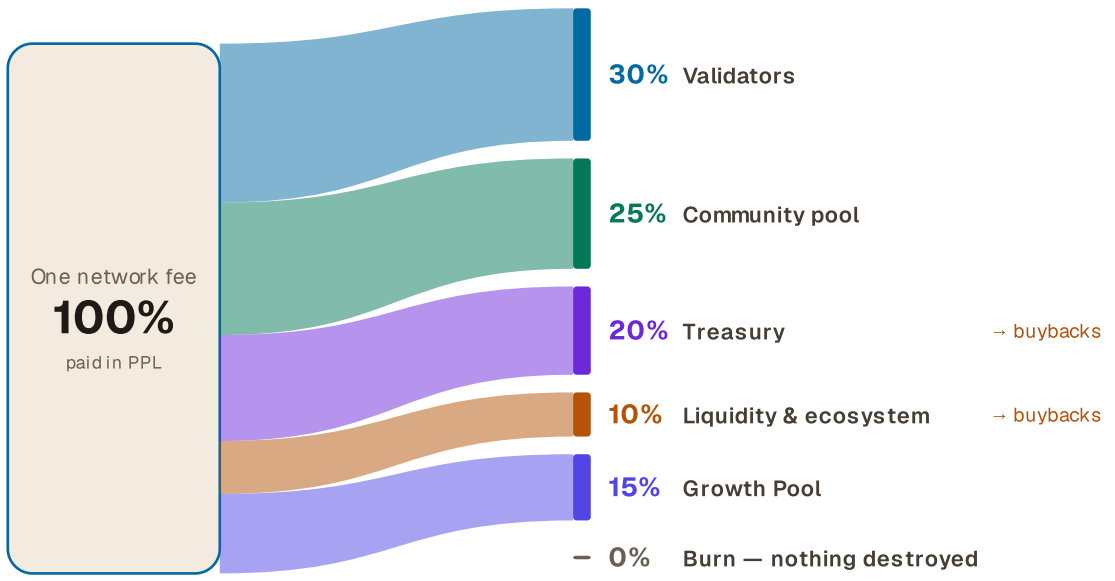

15% of supply. 0% at launch, a 6-month cliff, then 18 months linear — fully vested at month 24.

100% of token and NFT launch fees (USDC/USDT) go to public PPL buybacks. 30% of network fees go to public PPL buybacks (treasury 20% + liquidity 10%). The remaining 70% go to validators (30%), the community pool (25%) and the Growth Pool (15%) — and it all ultimately goes back to participants.

Genesis allocation

Bucket	Share	PPL
Community & rewards	35%	350,000,000
Validators & staking	20%	200,000,000
Team & founders	15%	150,000,000
Ecosystem treasury (DAO)	15%	150,000,000
Community sale	10%	100,000,000
Liquidity	5%	50,000,000

- **Team & founders vesting (15% of supply):** 0% at launch, 6-month cliff, then 18 months linear (24 months total).
- **No investor bucket.** There is no VC or private-round allocation.
- **Rewards come from existing pools.** Founders, bounties, ambassadors and airdrops are paid only from the Community & rewards bucket. No new coins are minted for them.

Network fee split

Every protocol fee, including fractional fees, is split the same way:

Recipient	Share
Validators	30%
Community pool	25%
Treasury	20%
Liquidity	10%
Growth Pool	15%
Burn	0%

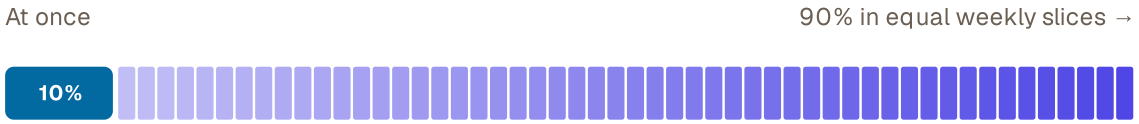

Fee flow. 100% of token and NFT launch fees (USDC/USDT) go to public PPL buybacks. 30% of network fees go to public PPL buybacks (treasury 20% + liquidity 10%). The remaining 70% of network fees go to validators (30%), the community pool (25%) and the Growth Pool (15%). It all ultimately goes back to participants. Nothing is burned to fake scarcity.

Token-launch fee. Live on testnet: the deployed factories currently charge a fixed fee in PPL — 1.045005 PPL to launch a token and 2.925 PPL to mint an NFT. The approved plan is a flat **1 USD per token launch and 2 USD per NFT mint**, payable in PPL, USDT or USDC, with a 20% discount for paying in PPL at a TWAP price. The stablecoin option and the TWAP discount are not in the deployed code yet. 100% of token and NFT launch fees (USDC/USDT) go to public PPL buybacks, and the bought-back PPL is split 30/25/20/10/15 by the treasury multisig, same as every other buyback.

07

Million Founders

Be one of the first million verified people. Get a founder number, invite friends and earn points when *they* do real things on the network.

Points come from real actions, not sign-ups. You earn invite points only after your invitee has verified, created a wallet and done at least one real testnet action (swap, liquidity pool, NFT mint, token launch or governance vote). Sign-up alone = 0.

How points become PPL:

> **PPL per point = season pool ÷ all points earned in the season**

- **Season 1 pool:** 6,000,000 PPL, paid from the existing Million Founders pool. No new coins. When the pool is empty, the program stops.
- **Payout:** 10% at once, the remaining 90% in equal weekly slices over 52 weeks.
- **Anti-farming:** two referral levels only, a per-season cap on active invitees, and clawback of points from accounts flagged as bots.

Preliminary. Points, the PPL-per-point rate and the season budget may change before mainnet. Not a promise of income.

08

Roadmap

Each stage starts when its gate is met. No dates are promised.

0 NOW

Season 0 · Public testnet

Wallets, verification, token launches, NFT cards, swaps, Million Founders points.

Now

1

PPL sale on Base

The PPL sale runs on Base only (PplCurveHub, USDC or USDT). Published sale parameters (exponential curve from $0.005 per PPL, up to 100M PPL on the curve, $4M graduation) are on /buy; purchases stay disabled until the sale contract is published. Mainnet of the PEOPLE network is a separate step.

Sale contract (PplCurveHub on Base) and receiving multisig published

2

Staking & validators

Staking and validator participation open beyond the project.

After mainnet

Stage	What happens	Gate
Season 0 — Public testnet	Wallets, verification, token launches, NFT cards, swaps, Million Founders points.	Now
PPL sale on Base	The PPL sale runs on Base only (PplCurveHub, USDC or USDT). Published sale parameters (exponential curve from **$0.005** per PPL, up to **100M PPL** on the curve, **$4M** graduation) are on `/buy`; purchases stay disabled until the sale contract is published. Mainnet of the PEOPLE network is a separate step.	Sale contract (PplCurveHub on Base) and receiving multisig published
Staking & validators	Staking and validator participation open beyond the project.	After mainnet

No dates are promised. Each stage starts when its gate is met.

09

Team & funding

- **Anonymous by choice.** A small team. We publish work, code and rules, not faces.
- **Self-funded.** No VC money. No investor allocations. No private round.
- **Same rules as everyone.** The team's 15% vests: 0% at launch, 6-month cliff, then 18 months linear (24 months total). There is no team line in the network fee split.

10

Security

- Reviewed by AI models: Claude Opus 5.5, GPT Astra, Fable 5.1 (run by the project team). This is not a security audit. No external audit has been done yet. Bug bounty: report a vulnerability from the bug button on any page.
- **Multisigs.** Network-fee treasury: a 2-of-3 multisig on the People network. Sale proceeds: the project multisig on Base; its address and signer threshold are published before the sale opens.
- **Published addresses.** The sale contract and the receiving multisig are published before the sale opens; vesting and LP-lock contracts at the full network launch. No placeholders.
- **Bot defence.** Human verification, per-device and per-IP limits, daily point caps and bot clawback.
- **Proven building blocks.** No-code contracts are assembled from OpenZeppelin templates.

11

Risks & disclaimer

- **No promise of income.** PPL, points and rewards are not an investment product. Nothing here promises profit, yield or returns.
- **Prices can go to zero.** Token prices can go up, down, or to zero.
- **Testnet is not mainnet.** Testnet tokens and balances carry no value. Points are a record of activity, not a payout guarantee.
- **Everything is preliminary.** Numbers, schedules and rules may change before mainnet and are subject to community governance.
- **Technology risk.** Software can have bugs. An audit reduces risk; it does not remove it.
- **Regulation.** Rules differ by country and may change. Published PPL sale parameters are on `/buy` (curve from **$0.005** per PPL); purchases stay disabled until the sale hub contract is deployed. No KYC or sale-eligibility checks run on this site.
- **Do your own research.** This litepaper is information, not financial, legal or tax advice.

What changed in v1.1

- A new token's community share is **10%** of supply: **10%** allocated at launch.
- Team vesting is **0% at launch, a 6-month cliff, then 18 months linear** (24 months in total).
- Launch fees: the approved plan is a flat **1 USD per token launch and 2 USD per NFT mint**, payable in PPL, USDT or USDC, with a 20% discount for paying in PPL at a TWAP price; the deployed factories still charge a fixed PPL fee.
- The **PPL community sale** uses the published exponential curve on `/buy` (starts at **$0.005** per PPL; prices and limits are public; the buy action stays off until the hub contract is deployed). No KYC or sale-eligibility checks are run on this site.
- Security: Reviewed by AI models: Claude Opus 5.5, GPT Astra, Fable 5.1 (run by the project team). This is not a security audit. No external audit has been done yet. Bug bounty on every page.
- Multisigs. Network-fee treasury: a 2-of-3 multisig on the People network. Sale proceeds: the project multisig on Base; its address and signer threshold are published before the sale opens.
- If a token's bonding curve does not sell out within **180 days** of launch, anyone can finalize it and the unsold tokens go to that token's community pool. A curve that sells out moves to liquidity as before. (Live on testnet.)

- The sale runs until it sells out (the curve closes at $4M raised) or for 24 months from opening, whichever comes first. No extensions. Unsold PPL goes to the Community Pool. No refunds: every purchase is final.
